Taxonomy of the order *Mononegavirales*: second update 2018*A full list of authors and affiliations appears at the end of the article.***Abstract**

In October 2018, the order *Mononegavirales* was amended by the establishment of three new families and three new genera, abolishment of two genera, and creation of 28 novel species. This article presents the updated taxonomy of the order *Mononegavirales* as now accepted by the International Committee on Taxonomy of Viruses (ICTV).

Introduction

The virus order *Mononegavirales* was established in 1991 to accommodate related viruses with nonsegmented, linear, single-stranded, negative-sense RNA genomes classified into three families [12, 13]. According to the previous ratification vote held in March 2018, the order included eight families [7]. Amended/emended order descriptions were published in 1995 [4], 1997 [14], 2000 [15], 2005 [16], 2011 [5], 2016 [1], 2017 [2], and March 2018 [3]. Here, we present the changes that were proposed via an official ICTV taxonomic proposal (TaxoProp 2017.016M.A.v1.Mononegavirales_rev) at <http://www.ictvonline.org/> in 2017 and were accepted by the ICTV Executive Committee (EC) in October 2018. These changes are now part of the official ICTV taxonomy as of October 2018.

Taxonomic changes at the order rank

In October 2018, the order *Mononegavirales* was expanded by three families. The family *Artoviridae* was created for the established genus *Peropuvirus* (moved out of *Nyamiviridae*) and six new species for B i hǎi barnacle virus 8 (BhBV-8), B i hǎi rhabdo-like virus 1 (BhRLV-1), B i hǎi rhabdo-like virus 2 (BhRLV-2), Hú b i rhabdo-like virus 5 (HbRLV5), Hú b i rhabdo-like virus 6 (HbRLV-6), and Hú b i rhabdo-like virus 8 (HbRLV-8), all discovered in invertebrates [8, 17]. The family *Lispiviridae* was established to include the floating genus *Arlivirus*; inclusion of the novel species *Hubei arlivirus*, *Odonate arlivirus*, and *Wuchang arlivirus* for Hú b i rhabdo-like virus 3 (HbRLV-3), Hú b i odonate virus 10 (HbOV-10), and Wú ch ng romanomermis nematode virus 2 (WcRNV-2) discovered in invertebrates; and inclusion of the (renamed) species of the now abandoned free-floating genera *Chengtivirus* and *Wastrivirus* [8, 17]. The family *Xinmoviridae* was established for the floating genus *Anphevirus*, and six novel species were added to the genus for Bolahun virus (BLHV), *Drosophila unispina virus 1* (DuniV-1), Hú b i diptera virus 11 (HbDV-11), Hú b i ortho tera virus 5 (HbOV-5), Hú b i rhabdo-like virus 7 (HbRLV-7), and Shu ngào fly virus 2 (SgFV-2) discovered in invertebrates [6, 8, 9, 17].

Taxonomic changes at the family rank

Bornaviridae

In October 2018, no changes were made at the family rank.

Filoviridae

In October 2018, no changes were made at the family rank.

Mymonaviridae

In October 2018, six new species were added to the genus *Sclerotimonavirus* for Hú b i rhabdo-like virus 4 (HbRLV-4), *Sclerotinia sclerotiorum* negative-stranded RNA virus 4 (SsNSRV-4), soybean leaf-associated negative-stranded RNA virus 1 (SLaNSRV-1), soybean leaf-associated negative-stranded RNA virus 2 (SLaNSRV-2), soybean leaf-associated negative-stranded RNA virus 3 (SLaNSRV-3), and soybean leaf-associated negative-stranded

RNA virus 4 (SLaNSRV-4) associated with soybean leaves, invertebrates, and fungi [10, 11, 17].

Nyamiviridae

In October 2018, the free-floating genus *Crustavirus* was included in the family and two novel species were added to that genus for B i hǎi rhabdo-like virus 6 (BhRLV-6) and W nling crustacean virus 12 (WICV-12) discovered in invertebrates. One genus, *Peropuvirus*, was moved from the family into the new family *Artoviridae*. Finally, the family was expanded by three novel genera that include a total of five new species for B i hǎi rhabdo-like virus 3 (BhRLV-3), B i hǎi rhabdo-like virus 4 (BhRLV-4), B i hǎi rhabdo-like virus 5 (BhRLV-5), Orinoco virus (ONCV), and W nzh u tapeworm virus 1 (WzTWV-1) discovered in invertebrates [8, 17].

Paramyxoviridae

In October 2018, no changes were made at the family rank.

Pneumoviridae

In October 2018, no changes were made at the family rank.

Rhabdoviridae

In October 2018, no changes were made at the family rank.

Sunviridae

In October 2018, no changes were made at the family rank.

Summary

A summary of the current, ICTV-accepted taxonomy of the order *Mononegavirales* is presented in Table 1.

Please note that viruses are real objects that are assigned to concepts that are called taxa. Species, genera, families, and orders are taxa. Taxon names are always italicized and always begin with a capital letter. Virus names, on the other hand, are not italicized and are not capitalized, except if the name or a name component is a proper noun. This column lists the virus names with their correct (lack of) capitalization. Lists of viruses within a given species are provisional at this point and will likely be amended in the near future.
